To whom it may concern,

Airlabs hired Enviro Technology to test a pollution control system using their air quality monitoring vehicle "The Smogmobile". They were able to record air pollutant levels in the passenger cabin while driving in heavy traffic in central London over a two day period, and connect the pollution levels to specific times and locations using GPS. The campaign went very well thanks to Enviro Technology's top of the line instruments and their knowledgeable and friendly staff. A couple of challenging situations arose during the course of the measurements and the Enviro Tech Engineer Lewis John was able to quickly find a solution and rescue the campaign. We are very happy to recommend this company for urban air quality testing and look forward to working with them again.

Best regards,
